

July 2024 Release Notes

Version 3.45.1

Draft orders to appear in new Orders Queue based on last modified date

In the June 2024 release, we introduced an enhancement to display orders in the new Orders Queue based on their last modified date. This enhancement made it easier to find orders that were originally created in the past but were recently modified. This was necessary because schedulers might need to take different actions on the order based on the change that was made ([see more details in the Release Notes for version 3.45](#)).

We identified a discrepancy related to draft orders after this update. When some orders previously saved as drafts were saved as real orders, users were unable to locate them in the orders queue. We temporarily resolved the problem beginning July 1, 2024, by running an updated script daily. In this release, we have corrected this discrepancy so that the daily script is no longer needed.

These orders will now be displayed in the new Orders Queue based on the last modified date as expected, ensuring that the most recently updated orders continue to be prioritized for processing.
